

Baby Universes

I was surfing Wikipedia for synonyms for "black holes" ...

I was surfing Wikipedia for synonyms for "black holes"; to see if it would help me come up with a name for my latest mix (I came up with "Transverible Nakedness" and "Cosmic Censorship," and I came across this interesting statement in the article on the "Black Hole Information Paradox": Information is stored in a baby universe that separates from our own universe: Disadvantage: It is difficult to find an appealing concrete theory that would predict such a scenario. Really, Wikipedia? You're surrounded by a very observable universe that apparently originated from a particle with infinite density, but you can't come up with a theory predicting that squishing matter from a collapsing star into a particle with infinite density might result in the creation of a universe? You've gotta scratch your head sometimes. Apparently Stephen Hawking talked about this a lot, but I'm still amazed no one was able to come up with something.
